Introduction: a. How to use the manual

European version of the ADolescent Assessment Dialogue

Developed by Alfred Friedman, Arlene Terras and David Oberg

I Introduction

a How to use the manual

This manual to the EuroADAD is designed to be used as both training material and for the daily work with the EuroADAD. The outline of the manual follows the course of the training in the instruments. The illustrations presented are identical to the overhead pictures used in the training. To facilitate the course of the training, a field for individual notes are provided in the right column of each page. Comments and clarifications can be noted here as an aid for later use of the EuroADAD.

The manual contains the general rules for the administration of the EuroADAD, procedures for coding the interview, as well as the basic concepts utilized in the development of the instrument

The manual is concluded with four appendices.

Appendix 1 Critical and composite questions

Appendix 2 Country codes

Appendix 3 EuroADAD form and

ADAD Feedback Form

Appendix 4 Client Treatment Matching Schedule

Adolescent Drug Abuse Diagnosis

Developed by Alfred Friedman and Arlene Terras at the Belmont Hospital in Philadelphia

The development of ADAD

The format of the ADAD was based on the format of the Addiction Severity Index (ASI) (McLellan, et al., 1980), a widely accepted instrument for the assessment of adult drug users. The ADAD differs in content from the ASI and includes many items which are unique to the assessment of the life patterns and needs of adolescents.

While the ADAD was originally developed for the purpose of assessing adolescents entering substance abuse treatment, because of its comprehensive nature, the ADAD has proven to be useful as a general assessment tool and is currently utilized widely in Australia, Europe and the United State, in agencies which provide more inclusive social services and assistance to adolescents.

lacktriangle	•	•

Friedman and Terras, 1989

• There is a need for a diagnostic method and an instrument appropriate for adolescent drug abuse clients, that permits to assign them to the most appropriate treatment setting, provides a base for individualized treatment planning, and facilitates comparability across research studies.

Introduction: EuroADAD

- ADAD developed by Friedman and Terras 1989 and modelled after the Addiction Severity Index
- EuropASI, 1994
- EuroADAD development of ADAD is started by Friedman, Terras and Öberg in 2000
- The EuroADAD group was constituted in 2001 and included 8 European countries
- In March 2002 the development of the first version of the EuroADAD is finalized.

The development of the EuroADAD

The ADAD came to Europe through Greece, Sweden and Switzerland. In those countries, the instruments were translated and adapted to the specific needs of the countries and organizations that translated them. This was done without any collaboration between the countries. When the interest for the ADAD grew in several other European countries, initiative was taken to create a standard European version. Experiences from the European version of the Addiction Severity Index (EuropASI, Blanken et al., 1994) has shown that a common standard is a precondition for the instrument to spread and to guarantee the quality of the method. The original authors Alfred Friedman and Arlene Terras started the development together with David Oberg from Sweden. The work was based on experiences from the American as well as the European national versions of the ADAD. The EuroADAD was developed in collaboration with partners from many European countries. This involvement provides possibilities for the EuroADAD to be of use in all European countries. EuroADAD can be seen as a method to describe, communicate and compare young clients over borders of countries and institutions. With time EuroADAD will be available in different language versions. This will make it possible to interview clients in their native tongue and thereby avoid translation errors.

In the development of the EuroADAD, mainly three types of problems were addressed.

1. Problems related to the heritage from ASI.

- **a:** Client ratings. The questions of "troubled or bothered" have been hard to interpret and of limited predictive value in statistical calculations. Furthermore, in reality, the item does not influence the severity rating, since the score on "need for help" always is the one to be considered. Hence, the questions of "troubled or bothered" have been excluded. This simplifies both trainings and the rating of severity.
- **b:** Severity ratings. The old descriptions of need for treatment in the severity ratings are easily interpreted as whether treatment is needed or not. The new definitions of the steps focus on a continuum from "no need for treatment/help" to "extreme need for treatment/help".
- **c:** The interviewer items have generally been considered as a deviation from the structure of the ASI. Items concerning in-

1	
ĺ	

Introduction: EuroADAD

• • • The European version of ADAD

- Upgraded and adapted for European context:
 - Comprehensive core
 - Items are more general
- Differences concerning:
 - · Areas: Employment is incorporated into School
 - Items
 - 25 % reduction
 - Some original items are changed or deleted based on research and clinical experience
 - · Database for complementary items will be established

terviewer clinical judgement and the severity ratings at the end of each area disturbs the flow of the interview and can easily be misunderstood as a necessary task to perform during the interview. These questions are no longer a part of the EuroADAD-interview section.

- **d.** The focus on problems. The ASI Feedback Form (AFF) is an integrated part of the EuroADAD. AFF concentrates on positive and negative aspects within every life-area, in order to lift forward strengths and the absence of problems when summarizing the interview and calculating the severity ratings.
- 2. Problems related with the construction of the original American ADAD.
- **a:** The name. Since the instrument does not provide diagnoses in any of the areas, the original name ("Adolescence Drug and Alcohol Diagnosis"), was misleading. The acronym "ADAD" is now an abbreviation of The ADolescent Assessment Dialogue, to stress that this is an assessment in close dialogue with the client
 - **b:** Inconsistencies. The original instrument does not systematically use the 30-days measure in all life areas. This is now introduced into all areas for increased consistency of the EuroADAD.
 - **c:** The areas. Studies have concluded that the area of "work" does not contribute to predictive value of the instrument. Furthermore, "work" is seldom of general relevance for the population of clients assessed with ADAD. "Work" is now briefly addressed in the ADAD with the recommendation to complement the interview with the area of Employment/ support" from the ASI, when relevant.

3. To get beyond the cultural context.

A great deal of developmental work has been focused on changes in the language of the interview items. The ambition has been to be more general, where the intention, not the exact phrasing of the question, has been in focus. This has been necessary in order to generate cross-cultural comparability and to facilitate translations from English. This work, more time-consuming than expected, has included close collaboration between the original authors, the European coordinator and the European representatives and field experts.

Information from EuroADAD

- o Fact based description of the adolescent
- o "Need of help" rated by the adolescent
- o Interviewer rating of severity
 - Subjective measure for clinical use
 - Measures severity and need for help
- Composite scores
 - Objective measure for research
 - Measures change

TI		
In_{D}	inctri	ument
Π	II ISU C	וווסוווג

The EuroADAD is a semi-structured interview that yields a multidimensional profile of problems adolescents. The following seven major problem areas are included: physical, work/education, social, family, psychological, criminal and alcohol/drugs. The interview provides an assessment of the life-problems of adolescents and indicates the treatment needs in each area. The quantifiable clinical information gathered through administration of the EuroADAD can be used for clinical, research and organizational purposes.

The instrument is a structured method to obtain information and can also be used to compare groups of adolescents between different countries and sectors of care. With help of the follow-up questions the individual can be followed over time, for example before and after treatment. With EuroADAD information relevant to adolescents' life experiences and current patterns of functioning are obtained. The seven life areas are evaluated separately and rated on the problems reported and the need for help. The EuroADAD also includes a section of general information in addition to the seven life areas.

Each of the life areas is constructed in the same way. Each includes questions that elicit facts pertinent to the adolescent's life for two distinct timeframes: for *lifetime* and for the *last thirty days*. The balance between historical and current information provides a purposeful insight into the intensity and the duration of the reported problems. All areas also include subjective questions on the youth's experience of the intensity and duration of the problems, whether or not the adolescent client wants help or counselling. The interviewer concludes each area with a severity rating that incorporates the objective information obtained, the interviewer's judgment, and the client's self-rating. The composite scores provide a objective measure that is useful in research and in outcome studies.

The EuroADAD is complemented with the EuroADAD Feedback Form — AFF. It was developed for clinicians to make the EuroADAD more useful for clinical practice. For example, client documentation, case-conferences and treatment planning. The AFF helps to make the severity ratings simple and consistent, develops a concise summary of the interview, provides a base for structured feed-back to the client. The global rating connects the different areas and identify patterns between them.

Introduction: Preparation

• • • General guidelines

- The interview should:
 - Be conducted after the adolescent is informed
 - Be conducted at one occasion
 - Be conducted in a calm and separate environment
 - Be properly introduced

\sim	TI	!	.!
,	In P	interv	$/1\triangle \backslash \Lambda /$
_		\mathbf{H}	$V \cup V V$

Preparation

It is appropriate that the interviewer to introduce him/herself and kindly ask for the client's cooperation for the ADAD interview. To inform the client and book time and place in advance is a good way to show the client respect and let them take the interview seriously. To start the interview it is not only of importance to be acquainted with the interview itself, also issues of confidentiality that apply in the specific situation have to be considered carefully.

Getting Started

The following is a sample introductory explanation of the ADAD interview process; all, or any part, may be used prior to and during the interview. It is intended only as a guideline and may be varied according to the clinical judgment of the interviewer and the needs of the setting: "Adolescent clients come to or are referred for social services often have problems in a number of different areas of their lives, such as school, family, as well as with drugs, alcohol and crime.. The ADAD interview is designed to develop a comprehensive picture of your experience and behavior in the following eight areas of your life: Medical, School, Employment, Social, Family Psychological, Delinquent/Criminal and Drug/Alcohol. For each section, you will be asked a set of questions. If you don't understand or are unsure about a question, please let me know, and I will explain it further. Then give me the best answer you can. Since almost all the questions deal with your experience or what you think or believe, it should not be hard for you. At the end of each section I will ask you how important you feel help or treatment, for the problems you reported in that particular area, is to you. We want to be sure to do the best we can for you, but we need your cooperation for this, since you are the best person who can tell us about yourself."

Depending on the client, it may be helpful for the interviewer to introduce each new problem section as the interview proceeds. For example: "Now I'm going to ask you some questions about your health and medical problems." The client will then be prepared to concentrate on each of the areas independently.

• • • Unclear???

- Always try to phrase the question so that the client can easily understand it.
- If the client does not seems to understand or seems unclear concerning the intention of the question:
 - Reformulate it
 - Ask clarifying or complementing questions
 - If it is still impossible, code "X" and make a note under comments
- Do not try to interpret what the client eventually means

Conducting the interview.

The questions in EuroADAD are not meant to be read to the client literarily. That's why it is important for the interviewer to be well acquainted with the interview and to understand the intent of the questions well. The intent of the questions should be delivered to the client in a way that the specific client can answer the question. To perform the interview in a accurate way it is important to be able to when necessarily reformulate the questions so that the intent in understandable. I some cases it is especially hard, like when the client lacks the ability to grasp the concept or when they cant handle the language well. Sometimes it is recommendable to check if the client really understood the question with an complementary question.

<u>Unclear</u> When the client does not seems to understand or is unclear with the intention of the question:

- Reformulate the question
- Ask a clarifying or complementing question.
- If the client still can't understand, code "x" for question not applicable, and make a note under comments.

<u>Termination</u> Normally the interview takes about 45 minutes to one hour and should be conducted at one occasion. If the client is not able to perform the interview in one session, it can be split up in 2 or more sessions. The interview should be terminated if the client obviously can not or will not answer many of the questions. If the client does not understand the interview because of language problems it is possible to conduct the interview with help of a interpreter. In those cases it is important to note that the quality of the interview and the comparability will be reduced if the interpreter is forced to translate the interview. If a suitable language version available it should be used.

• • Reliability

- If the information is significantly (extremely) distorted on purpose by the adolescent
 - Stress on the importance of the interview for the adolescent
 - Stress the possibility to not answer the question
 - Terminate the interview and resume it at a better moment

Introduction: Coding

• • •	C	odi	ing	J

- 0 = No
- \circ 1 = Yes
- N = Not relevant
- X = No answer

Coding

The coding in EuroADAD normally follows the pattern of 0 = No and 1 = Yes. There are also codes for when the question is not applicable (n) or not answered (x).

<u>Date:</u> Always code the date when something happened (not hove many months that has passed since it happened) The coding of dates follows the international standard ISO 8601, that means

Year - Month - Day. (YYYY-MM-DD or YY-MM-DD). Example: When was the last time you stayed in a hospital for physical or medical problems: YY MM=0108=August, 2001

<u>Country code</u>: Also the country codes follows international standard and consists of three digits. The name of the standard is ISO 3166. A code list with country codes could be found in the appendix. Note that clients that are without citizenship will be coded "000". Country code concerns questions AB and B3.

<u>30 day measurement:</u> Several questions in the interview concerns current situation, that is the last 30 days. Normally they are counted from the day of the interview. In those cases were the client has been in secure environment part or all of the last 30 days, count the 30 days from the day <u>before</u> he got into secure environment. This puts an extra emphasis on conducting the interview as close as possible to intake since the info. can be less reliable with time.

• • •

30-day measurement

When the client is interview in:

- Normal environment
 - Count the last 30 days before the interview day
- Secure environment
 - Count the last 30 days before the client got into secure environment

]	

Rules for coding

- Do not leave any fields empty, when necessary code:
- X = Question not answered
 - Can not answer
 - Will not answer
 - Question not asked
- N = Question not relevant
 - Ascending questions, i.e., questions that start with "if Yes, ..." etc.
 - Consequence questions, f.ex. if single child, questions about brothers or sisters are not relevant

Estimates/clarification

Several questions require the client to estimate the "number of days" he/she experienced a particular problem during the preceding period. These items can be difficult for adolescent clients, and it may be helpful to offer a time structuring mechanism; e.g., fractional periods (one-half the time, or weekends only, etc.). During the interview, there are opportunities for clarification of questions and responses. If a client does not understand the question, you can rephrase the question or give examples.

NOTE: When it is firmly established that the client does not or cannot understand a particular question, that response should not be recorded. Enter an "X" in the response box of that item.

Missing values

It is absolutely necessary not to leave any fields empty. When you are unsure about the coding make a preliminary coding and write down a note under comments. After the interview, contact somebody who could help you to write down the correct code. Two codes are available to avoid empty fields.

Don't know (X). The client should be informed before the start of the interview that it is no problem if the client does not want or cannot answer a question. In those cases it is better that the client answers with "no comment" than with a lie or an incorrect answer. This code also applies when the client does not know or understand the question. In those cases that the interviewer do not ask a question, it should also be coded with X. If you have to use X, please make a note under comment

Not Relevant (N). Sometimes it is not possible to answer a question because the question is not relevant. There are two reasons why a question can be not relevant.

Ascending questions, is questions were the answer depends on the answer on the **preceding** question. They are often numbered a, b, c. for example "If yes on a ..." If the client answers No=0 on question a, the code will be "N" on question b.

<u>Consequence questions</u>. The answer depends on how the client has answered on a **previous** question. If the client says that he is engaged in school on D1a then should questions D12 to D14 be coded "N". This kind o f questions are often found within a bold square.

]	

Introduction: Client's rating scale

• • •	Comments
0	In the end of ea
0	If information of the interview, use

- ch area
- importance comes up under e the comments field.
- Extra information of relevance for the severity rating should here be noted and explained
- Further explanations that provides a context to the interview could here be noted together with other information of clinical relevance

In the end of each section there is a section for comments. This section has several purposes. Here should be noted any information of importance that comes up during the interview and that is not coded in any of the questions. Further explanations that provide a context to the interview could here be noted together with other information of clinical relevance.

A. Administrative information Administrative information These questions aim to identifying the interview, the interviewee, the interviewer and the interview situation. They can be filled in by the interviewer or by administrative staff. Instructions for specific items AA I.D. number is the file number given to the client by the unit. If applicable, the number given for research purposes is noted on the upper left box of each page. AB Country code: Use three digits, see appendix AC Unit code is given by the organization, responsible for data collection of EuroADAD AD Interviewer code number is given by the organization, responsible for data collection of EuroADAD AF Date of admission is the date that the client is subscribed at the unit and treatment officially is started. AG Date of interview is the date that the EuroADAD interview is conducted. If the interview is conducted at several occasions, code the first date. **Optional Questions** Only when the EuroADAD is utilized for research purposes only, should this section, which asks for client-identifying information such as name, address, and nearest relative, be omitted. When the EuroADAD is used for clinical, as well as research purposes and the confidentiality procedures must be maintained, it is possible to blank out this section.

General information General Information This section collects general, background information on the client's situation. Instructions for specific items B3 Codes for country of birth, three digits, see appendix B5-B7 Clarify for the client the difference between biological/adoptive parents and current family arrangements (B10-B11). B7 Don't Know = "X" is used for clients who don't know or never knew their parent's life status. However, if the client is simply not sure, have him/her make his/her best guess. B7a Separated/Divorced means living in separate houses and/ or legally being divorced. B7b The client's age when the parents divorced/separated B8 With whom have you lived C Lifetime For clients who have had multiple arrangement in their lifetime code their primary living arrangements or, alternatively, the arrangement in which they spent the most time. 7 Other relatives = blood relatives first and second degree. More distant relatives should be coded under 14=Other and a note is made B9 What do your parent figures currently do For this item, the parent figures are those who had primary responsibility for the client during the last year. B10 How many brothers/sisters do you have Includes also step-and half siblings. In this case, make comment at the end of this section. Only mention those that the youngster has contact with and has some influence on his/her B11 Do you have any children. Includes all children not deceased. Children may be living elsewhere. For male adolescents: if unsure, code "X", and make comment B12 How many people altogether live in your household. (Refers to the situation on question B8b; include client in total of people) Includes all people whose primary residence is the same as that of the client. If the client attends boarding school, is in residential care, or is incarcerated (codes 9 or 10), this item refers to the residence of the client when on

without permission from parent figures and has the intention to run away.

B15 How many times have you run away from home. A client is considered to have run away if he stays away overnight

The client rating scale 0 = None/Not at all 1 = A little 2 = A fair amount 3 = A lot None a little a fair amount a lot 0 1 2 3

Client's Rating scales

This 4-point client rating scale (which appears at the end of each problem section) will be used by the client to estimate the importance of counselling or treatment in each problem area. The interviewer may describe the use of the scale prior to beginning the interview, but it is not required. The rating scale ranges from 0 to 3. If the client reports that treatment is not at all important, code 0 = none. If the client reports that treatment is a little important, code 1 = a little; similarly, code 2 = a fair amount and 3 = a lot, according no the client's report. It may be helpful for the interviewer to restate the code descriptors for the client after the "importance of treatment or help" question is asked. For example, "How important to you now is help medical problems? None? A little? A fair amount? or A lot?"

The client should be directed to make the ratings on the basis of his/her reactions to the current problem situation, i.e. to the problems the client actually experienced in the preceding 30 day period. (see 30 days measurement, page 10)

• • • The client rating scale

- Concerns current situation
- Concerns problems expressed in the interview
 - That why it is of utter importance that complementing information are noted under comments
- Concerns the need for further or continues help

Introduction: Interviewer se	everity r	atings
------------------------------	-----------	--------

Interviewer Severity Ratings (ISR)

- ISR provides a summary of the client's problems at intake
- ISR could be used for:
 - Matching client-unit
 - Treatment planning
 - Prediction of treatment outcome

1 1 1	• • •	1.1
Intorvious cov	α rit\/	ratinac
Interviewer sev	\Box III V	tauius

The severity ratings derived by the interviewer in each of the problem areas are important to both research and clinical goals. All ratings are to be based on responses to both the objective and subjective questions within each area. Although it is recognized that the interviewer's opinions will affect the severity ratings, and are often important, they introduce a non-systematic source of variation, lowering the overall utility of the scale. In order reduce these variations, the interviewer must develop a systematic method for estimating the severity of each problem. The common use of this standard method will increase the reliability of the severity estimates.

A two-step method for estimating severity has been established (similar to the ASI). In the first step, the interviewer considers only the objective data from the problem area, giving particular attention to the critical items (marked in bold and underscored) in each area. These items have been found to be consistent with higher levels of severity. The interviewer then makes a preliminary rating (2-3 digit) of the client's problem severity (need for treatment) based only upon this objective data. Next, the Client's Ratings of his/her need for help are considered; and than the interviewer narrows the range to a single, final digit.

Introduction:	Interviewer	severity	rating

•	•	•	
•			

Interviewer Severity Ratings

- An estimation concerning the need for treatment, independent on the availability or even existence of treatment.
- Treatment is a combination of "objective" and "subjective" information
- Provides a structured method to summarize and "understand" the nature of the client's situation

If the client suggests that he/she feels that treatment is "extremely important" to him/her, then the interviewer chooses the higher value in his/her final rating. Similarly, in situations where the client convincingly reduces the need for help, the interviewer may reduce the final rating. Quite often, however, adolescents understate, minimize and deny their need for help. In these cases, the final rating should reflect their verbal report, including their views on the current importance of help and interventions for their problems.

For the purposes of this interview, severity will be defined as need for additional treatment and will be based upon reports of amount, duration, and intensity of symptoms within a problem area. (The word "additional" here means treatment that is needed beyond that which the client may already be receiving. In most cases, however, the client is not receiving any other treatment.)

One of the most important benefits of the ISR system is that it provides the interviewer with a structured method for analyzing the information in the interview. This method enhances the clinical value of the interview and facilitates communication with the client, colleagues and others involved.

Introduction:	Intorviouvor	covority	/ ratings
11 111 ()(111.1.1.1.1.1.1.1.1.1.1.1.1.1.1.1.1.1		2676111	/ lallius

• • • Intervie

Interviewer Severity Ratings

- o Interval 0 9
 - 0 = No real problem/need for help
 - 9 = Extreme problem/need for help
- The interviewer rates the need for help based on strict rules
- The rating is based on both objective and subjective information – a two step method

For the purpose of making the severity ratings, the interviewer uses the interviewers rating scale (IRS). This is a 10 point scale divided into five categorical explanations or definitions. Each represent the client's need for treatment and the level of treatment appropriate to the client's need.

- •0-1 No real problem/need for help
- •2-3 Slight problem/need for help
- •4-5 Moderate problem/need for help
- •6-7 Considerable problem/need for help
- •8-9 Extreme problem/need for help

It is important to note that these ratings are not intended as estimates of the client's potential benefit from treatment, but rather the extent to which some form of effective intervention is needed, regardless of whether that treatment is available or even in existence. For example, a client with terminal cancer would warrant a medical severity rating of 9, indicating that treatment is absolutely necessary for this life threatening condition. A high severity rating is recorded in this case even though no effective treatment is currently available.

Clients presenting few controlled symptom levels should be rated as having a low level of problem severity. As amount, duration, and/or intensity of symptoms increase, so should the severity rating. Very high severity ratings indicate high levels of problem symptoms and a correspondingly high need for treatment. Lower ratings do not necessarily mean that help is not needed, but more that the kind of help could be of a lesser intensity and/or kind than with a higher rating.

• • •

Interviewer Severity Ratings

- 10 degree scale
 - 0-1 No real problem/need for help
 - 2-3 Slight problem/need for help
 - 4-5 Moderate problem/need for help
 - 6-7 Considerable problem/need for help
 - 8-9 Extreme problem/need for help

Objective information Preliminary rating - 2 to 3 digits Clients rating of need for help Choose 1 digit from prel. rating

EuroADAD FeedbackForm (AFF) at

EuroADAD Feedback Form (AFF),in appendix 2, facilitates the procedure of deriving the interviewer severity ratings. The AFF is a document of the interviewer's thoughts and impressions when making the ratings. Utilizing the information the client provided in the course of the interview, the AFF guides the interviewer through the process of making the severity ratings. While it is not necessary to use the AFF to generate the severity ratings, it provides a standard methodology which we have found leads to more consistent ratings. AFF has been particularly helpful to new interviewers as a step-by-step method through the rating process, and it has been found to be a good pedagogical tool for training activities.

The EuroADAD Feedback Form (AFF) was developed for clinicians and for the purpose of expanding the clinical applications of the EuroADAD. As such, it may be utilized for client documentation, case-conferences and treatment planning, etc. The AFF has four main purposes:

- Provide a simple and consistent severity rating method
- Develop a concise summary of the interview
- Provide a structure for feed-back to the client
- Provide and overview of the different areas and an opportunity to identify patterns

•	•	•	ADAD	Feedback	Form
---	---	---	------	----------	------

- Make the severity ratings simple and consistent
- Develop a concise summary of the interview
- To provide structured feed-back to the client
- Connect the different areas and identify patterns

Introduction: Interviewer severity ratings

• • • ISR Step 1.

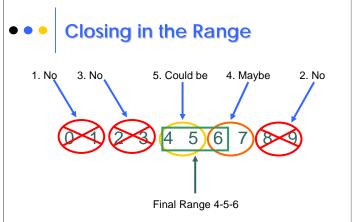

- 1. Look over the interview.
- 2. Items are considered of more importance (+ positive or - negative) if they are:
 - Critical questions (<u>bold and underlined</u>)
 - Close in time
 - Over a longer period
 - Acute
 - Chronic
 - Severe

Interviewer Severity Rating, Step 1.

- 1. Look over the interview.
- 2. Consider what is positive for the client, which gives a lower rating, and what is negative, which gives a higher rating. The absence of problems is considered positive. Items are considered to be more important (+ positive or negative) if they are:
- Critical questions (**bold and underlined**)
- Close in time
- Have a longer duration
- Acute
- Chronic
- Severe

Take in consideration if adequate treatment is already in use. Information reported by the client **not** in response to a EuroADAD question, but is factored into the derivation of a severity rating, must be recorded in the "Comments" section.

3.Create a range of 2-3 digits which express the interviewer's (your) views on the <u>nature and severity</u> of the problem and rate the client's <u>need for help</u>. The procedure is to narrow down from the end points into a range of two to three digits. Ask yourself, for example, if the severity is 0-1. If not, is it 8-9? If not, is it 2-3, etc., until you find the range of 2-3 digits that (in your view) best reflect the client's need for help. The operational definitions of each severity category may be helpful in establishing a range.

Introduction:			4.1
Introduction	Intarviaviar	COVARITY	ratinas
IIIII OGGCIIOII.		3C / CIII /	Taurus

Severity rating - Step 2

- Use the subjective information from the clients rating for help to choose a value in from the preliminary interval.
 - For 2 digit interval
 - If client rating is 0 or 1- choose the Lower value
 - If client rating is 2 or 3 choose the Higher value
 - For 3 digit interval
 - If client rating is 0 choose the Lower value
 - If client rating is 1 or 2 choose the Middle value
 - If client rating is 3 choose the Higher value

Interviewer Severity Rating, Step 2.

Next, the Client's Ratings of his/her need for help are considered, and the interviewer narrows the range to a single, final digit. If the client suggests that he/she feels that help is "extremely important" to him/her, then the interviewer choose the higher value in his/her final rating. Similarly, in situations where the client convincingly reduces the need for help, the interviewer may reduce the final rating. Guideline for final rating

For 2 digit interval

If client rating is 0 or 1– choose the Lower value If client rating is 2 or 3 – choose the Higher value

For 3 digit interval

If client rating is 0 – choose the Lower value If client rating is 1 or 2 – choose the Middle value If client rating is 3 – choose the Higher value

Interviewer Severity Ratings

OHow would you rate the client's need for help or counseling for ...

- Extreme problem/need for help Considerable problem/need for help
- Moderate problem/need for help Slight problem/need for help
- No real problem/need for help

B Physical health
C Physical
C5 This item refers physical illness which is not the direct result of alcohol/drug abuse. It asks the client's subjective perceptions of serious illness.
C6 A chronic condition is a serious, or potentially serious, physical or medical condition that requires continuous care on the part of the client (e.g., medication, dietary restrictions, inability to perform normal activities). Some examples of chronic conditions are hypertension, diabetes, epilepsy, and physical handicaps.
C7 b If medication is prescribed for psychological problems, code under G3 k and describe under G7, comments.
C9 Refers to both current and past problems.
C9 a Eating problems can be problems with swallowing, vomiting, eating too little and overeating, lasting longer periods.
C9 e Give examples of sexually transmitted diseases, e.g., gonorrhea, chlamydia, syphilis, genital warts, genital herpes etc., or describe the symptoms: visible sores, warts, discharge from penis/vagina, painful urination
C9 f: To make the client feel more comfortable, ask first if he/she was ever tested for HIV, and if yes, if he/she will share the status.
C9 g: Only applies for girls, code N for boys

D School and Employment

D1: "Still in school" (code "1") means that the client is participating in some kind of "regular", formal educational process such as public and private junior and senior high schools. It excludes all programs that do not grant a high school diploma upon completion of the program. This response option includes work-study, and training programs, which are structured to provide a high school diploma.

Code 2 In work, means a work that is paid for, not a work-study

Code 3: Educational program includes "special" schools for the socially/ emotionally disturbed,

Code 4: In treatment, when clients are in residential care and do not attend regular school

Code 5: Other structured daytime activities could be voluntary work or "daycare" for adolescents that are expelled from school

Code 6 Not allowed to go to school. Being temporarily extended or permanently expelled.

Code 7 Stopped going. This decision is made by the youngster.

Code 8 Not into any of above. Write down other options, like not able to go to school because of longstanding illness, education at home.

D2 Start counting regular school years at age 6.(schools in different countries start with first class at different ages). Only include schools referred to in D1

D6: If grades were variable during the past school year, the response should reflect the general tendency or average.

D10 –D11: These items are not applicable ("N") for clients who have not been enrolled in school at anytime in the past 30 days. They are applicable however, to clients who have not attended school in the past 30 days, but are still on roll.

Items D12 – D13: All clients who were not coded as "1" (still in school) on Item D1 are appropriate for this section.

D14 Clients with less than 20???? hours a week of school, educational program or (voluntary) work are considered not to have structured daytime activities.

E Social

E Social

- E 3: Ask and enter number responses for sub-items a e, even if client does not have as many as five (5) friends. Enter the total number of friends the client considers for this item in sub-item f.
- E4 a: A gang is generally an organized group involved in criminal/illegal/socially unacceptable activities, which may have a certain hierarchy or structure in which the client has a role, for example Hell's Angels or criminal ethnic gangs. There should be more than a lose connection between the gang members.
- E5 b: "Partying" at home or outdoors, etc., refers to social activities without parents/supervising adults and where alcohol and drugs may be used.
- E7–E15: It can be useful to provide the following brief introduction: Now I am going to ask you some questions about sexuality and relationships.
- E7: Code unsure if the client thinks/worries about his/her sexual preference, and is not sure. The question could also be rephrased.
- E8 and Item E11: Please use both male and female terms (e.g. "boy or girl friend") when interviewing either sex to provide a gender-neutral atmosphere and avoid the assumption of heterosexuality.
- E8: If the client does not have a partner but has sexual relationships, write down number of sexual partners and make a comment.
- E13 a: The question withholds whether the client prevents pregnancy
- E13 b: The question withholds whether the clients protects him/herself against sexually transmitted diseases
- E15 Code unsure if the client has doubts, otherwise code 0

F Family

F Family

F1 Refers to biological/adoptive parents and parent substitutes (step, foster, etc.)

F3–F17 Refers to the family with whom the client has been living for the past year (see B10 b). If the client's answer to B10 b is not a parent or parent figure (codes 1-8), enter "N".

Sometimes the client lives with a stepparent, or only one of the parents, but the biological parent has an important role. The questions can in that case also be asked for the biological parent. A note is made under comments.

F16 Abuse most often occurs within families, but may also abuse involve others in authority positions.

- a Beaten up/battered
- b Penetration is not necessary for sexual abuse; sexual harassment and intimidation by a person older and more powerful is also included. Rape or unwanted sexual acts by/with peers are noted in the social section, under comments.
- c Emotional abuse may include being bullied, verbally degraded and disrespected.

C Psychological	
G Psychological	
G Psychological	
G1 a: Refers to the number of treatment episodes or courses of treatment, not the number of counseling or treatment sessions.b: Refers to the number of individual, separate psychiatric hospitalizations.	
G2 Refers to current (past 30 days) feelings and reactions	
G2 e Clients often have certain words they use to understand this item (flipping, acting out)	
G2 h Client's that have crazy ideas know what you mean, others will ask you what you mean with crazy and than you can let them give an example.	
G3 d Trouble controlling violent behavior does not have to be during a significant period of one week, but can be more up and down.	
G3 k If clients did not take the medication as prescribed make note.	

I	

H Crime

H Criminal

H1 Picked up means taken by the police to the police station or a separate room for questioning.

Items H2 b, H5 b, H6 b: If the client is on probation, has been in jail, or is currently awaiting charges, trial or sentence, be sure to enter the appropriate offense code letter (a-q) in the field and explain in words if needed on the line provided. Otherwise, enter "N" = not applicable.

Item H7(3): This sub-item requests the number of times each illegal act was committed by the client **in the past 3 month period**. As such, it is the only use of a 3 month time-frame in the EuroADAD. Please be sure that the client understands that he/she must review his behavior for a 3-month period rather than the usual 1 month period.

Sub-item H7 m: To maintain a comfort level with client, the following question may be used as a lead-in to this item: "Did anyone ever accuse you of rape?

Sub-item H7 p: Similarly, the following question may be used as a lead-in to this item: "Were you ever involved in someone's death?

I Alcohol/Drugs

I.Alco	hol	and	Drugs
		O O.	0. 90

I (1- 5): Be sure to distinguish between (1) "ever used", (2) "age of first use", (3) "days used the past 30 days", (4) "peak use frequency", and (5) "duration of use".

Age of first use alcohol is the age the person for the first time experienced the effects of it

Peak frequency means the number of days of use in the months the client used the most often, irrespective of the amount.

Duration of use means more or less regular use of the different types of alcohol and drugs

I 7: Is only applicable when the client has been drinking/using drugs for a longer period.

I 16: The interviewer must determine the major substance based on the average frequency of use for the past 30 days and the years/months of use. When not clear, ask the client.

I Severity Ratings

8 Recording the Ratings

Although reference is made to seven (7) problem areas, there are actually eight (8) problem areas for which the interviewer makes a Severity Rating and the client makes a rating for help. The eighth section of the EuroADAD instrument subsumes drugs and alcohol, but requires that a separate Severity and client Rating be made for drug abuse and alcohol abuse.

After making the eight (8) severity and client ratings, with help of the EuroADAD Feedback Form for each area in its appropriate place within the form, complete the ratings grid on the EuroADAD face sheet or the EuroADAD Feedback Form.

ADAD Feedback Form - AFF an aid for EuroADAD interviewers

Background

The AFF was developed for clinicians to make the Euro-ADAD more useful for clinical practice, thus improving their work by giving them a tool they can use. For example, client documentation, case-conferences and treatment planning. The AFF has four purposes:

- 1. Make the severity ratings simple and consistent
- 2. Develop a concise summary of the interview
- 3. To provide structured feed-back to the client
- 4. Connect the different areas and identify patterns

Method

The AFF puts on paper the interviewers thoughts and concepts when making the severity rating. Based on the information the client has given in the EuroADAD, it guides the interviewer in a practical way through the process of making the severity ratings. After the form is completed the severity rating is coded in the table on the front page of the EuroADAD form.

Instructions

General

Look over the interview. Items are considered of more importance (+ positive or - negative) if they are:

- Close in time
- Over a longer period
- Acute
- Chronic
- Severe
- Critical questions (bold and underlined)

Severity Rating

- 1) Consider what is positive for the client, which gives a lower rating and what is negative, which gives a higher rating. The absence of problems is considered positive.
- 2) Create a range of 2-3 digits which express the interviewers view on the severity of the clients problems. This can be done by narrowing down from the end points into the range of two to three digits. For example: is the severity 0-1, no. Is it 8-9, no, is it 2-3, maybe, is it 6-7, no, is it 4-5, yes. Here the interval will be 3-4-5.
- 3) Fill in the clients rating for from the EuroADAD and consider those in the final, single digit, rating.
- 4) Write down the rationale. The rationale explains the way the interviewer interpreted the information the client has provided and is the basis of the feedback.

Global Rating

- 1) Use the information of all the items you considered of importance to make a range of 3 digits that reflects a global problem severity of the client. You can do this by narrowing down from the endpoints.
- 2) Identify the patterns between items in different problem areas. These patterns can be positive or negative. E.g. (+) works, family and friends without problems, (-) alcohol use, conflicts in family, depressive mood.
- 3) Consider the rules written in the general instructions to identify the importance of the (+) protective and (-) destructive patterns. If the patterns are predominantly positive, use the lower value in the range, if they are predominantly negative, use the higher value, otherwise, use the middle value. Write down the final, single digit, rating.
- 4) Write down the rationale.

After all of the ratings are completed. Code the ratings in the table at the first page of the EuroADAD form.

Maastricht 2002-04-07, © David Öberg, Björn Sallmén,

EuropADAD Interviewer Severity Ratings and Client Treatment Matching Schedule

0-1 No real problem, treatment not indicated

Treatment matching implications: Primary prevention, provision of information. The level of intensity may range from written materials, informational groups, or a single/or time limited individual session(s).

2-3 Slight problem, treatment probably not necessary

Treatment matching implications: Harm reduction, prevention, provision of information, counselling, further screening or assessment, relapse prevention, or ongoing sessions to support and monitor the maintenance of change. Interventions may range from written materials, informational or support groups, short term or limited individual sessions, or individual sessions supporting and monitoring the maintenance of change.

4-5 Moderate problem, some treatment indicated

Treatment matching implications: Ongoing outpatient interventions working towards specific therapeutic goals. Sessions may be group or individual with regular therapeutic contact focusing on therapeutic goals, with sessions scheduled fortnightly to multiple times in a week.

6-7 Considerable problem, treatment necessary

Treatment matching implications: Ongoing, goal-focused interventions ranging from sessions multiple times in a week to daily contact. These interventions may include intensive outpatient contact, voluntary residential or voluntary inpatient treatment.

8-9 Extreme problem, treatment absolutely necessary

Treatment matching implications: Goal focused interventions provided in highly monitored and structured inpatient setting. Due to severity of problems, capacity of client to make decisions has been judged to be affected, with these interventions reflecting less client choice, such as when clients have been hospitalised involuntarily or are otherwise required to participate in intensive treatment.

Laura Freeman 2001
